# SYSTEMS, METHODS AND DATA STRUCTURES FOR GENERATING COMPUTER-ACTIONABLE COMPUTER SECURITY THREAT MANAGEMENT INFORMATION

## Abstract of the Disclosure

5  Computer security threat management information is generated upon receiving notification of a computer security threat, by generating a computer-actionable Threat Management Vector (TMV) from the notification that was received. The TMV includes a first computer-readable field that provides identification of at least one system type that is affected by the security threat, a second computer-readable field

10  that provides identification of a release level for the system type, and a third computer-readable field that provides identification of a set of possible countermeasures for a system type and a release level. The TMV that is generated is transmitted to target systems for processing.
